Hard times: The Great Recession and the effect of job loss on household incomes

CORRODE - Corroding the social? An empirical evaluation of the relationship between unemployment and social stratification

A comprehensive evaluation of the relationship between unemployment and social stratification in Europe and North America. Estimate the impact of household unemployment experiences on...

1. ...household incomes
2. ...household demographic behavior
3. ...household educational participation
4. ...household social integration and civic and political participation

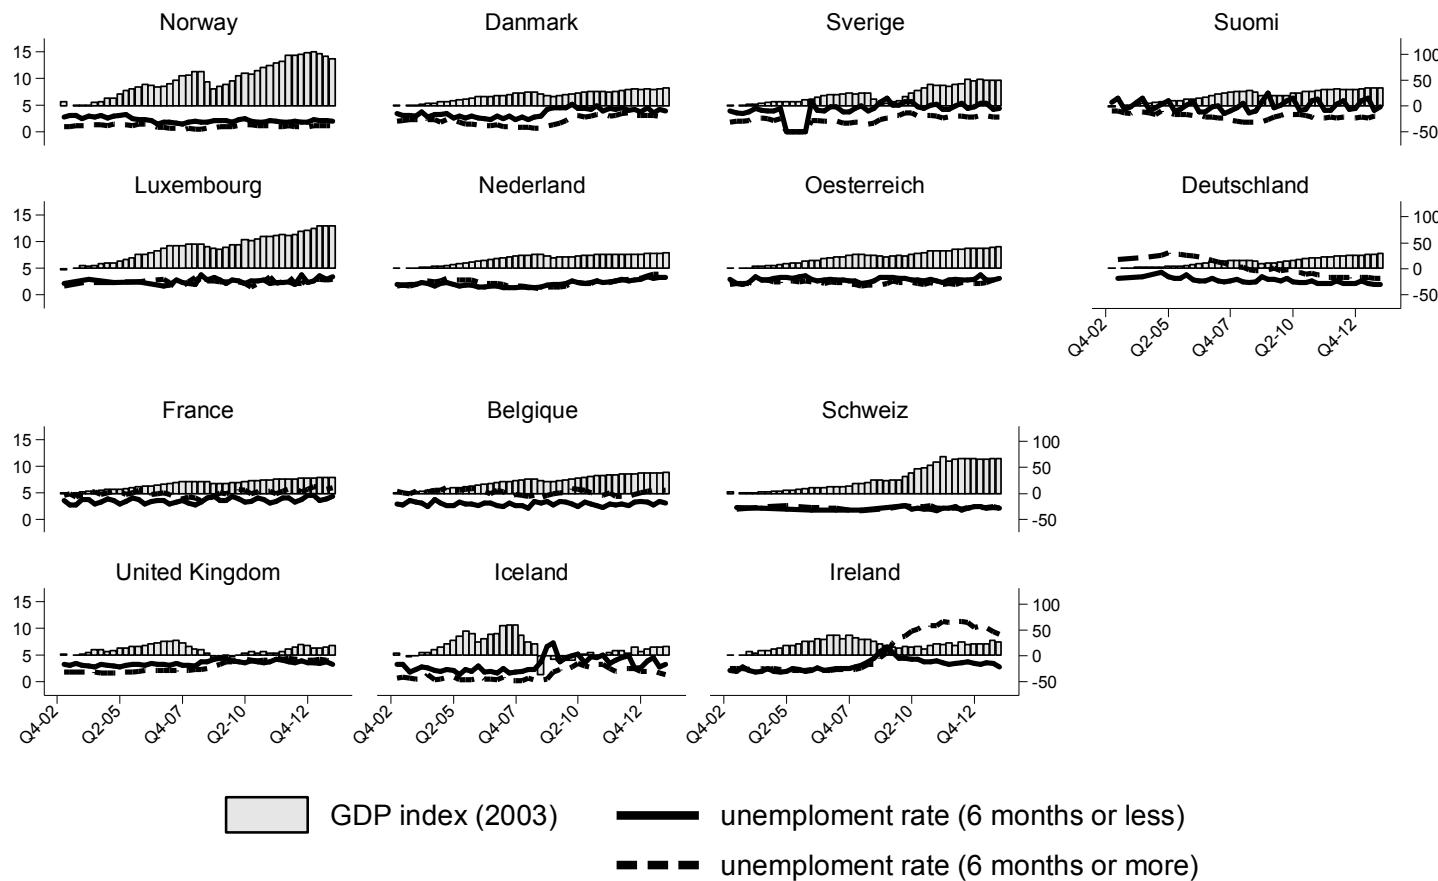

Background

Previous research: effect of unemployment on household income trajectories and how the family and welfare state buffer income loss at national level (DiPrete and McManus 2000; Ehlert 2012; Ehlert 2013).

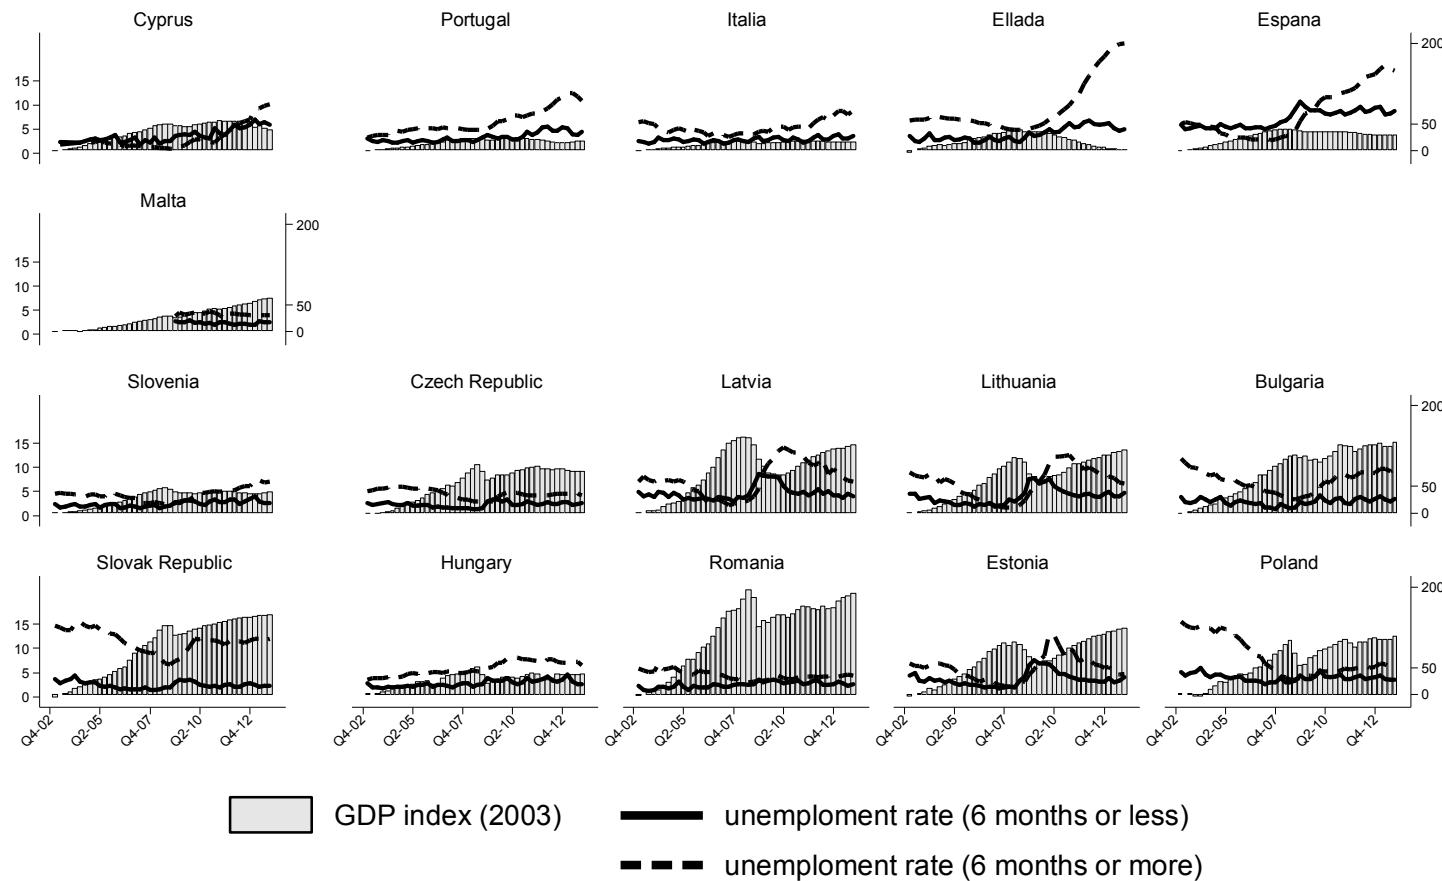

- Focus on comparative perspective: welfare states, changing macro-economic conditions
- The consequences of individual unemployment for household incomes in different contexts:
 - Short- and medium-term effects of recent job loss
 - 2003-2013
 - Focus on the Great Recession

What happened? - Impact of the Great Recession

Source: Eurostat EU Labour Force Survey

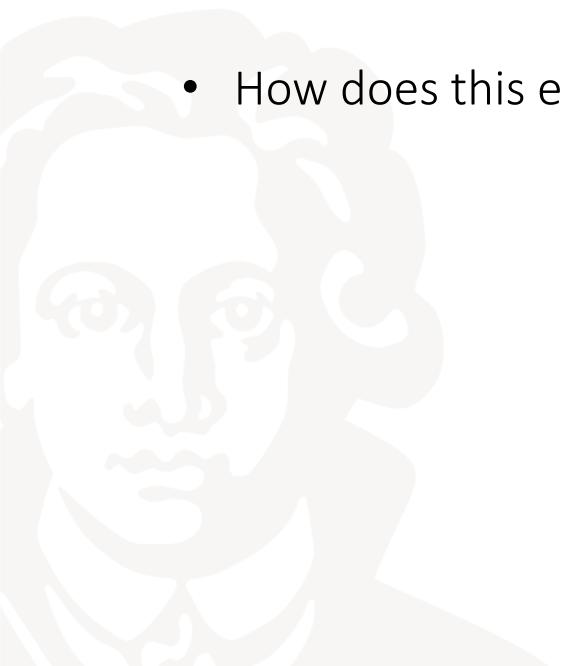

What happened? - Impact of the Great Recession

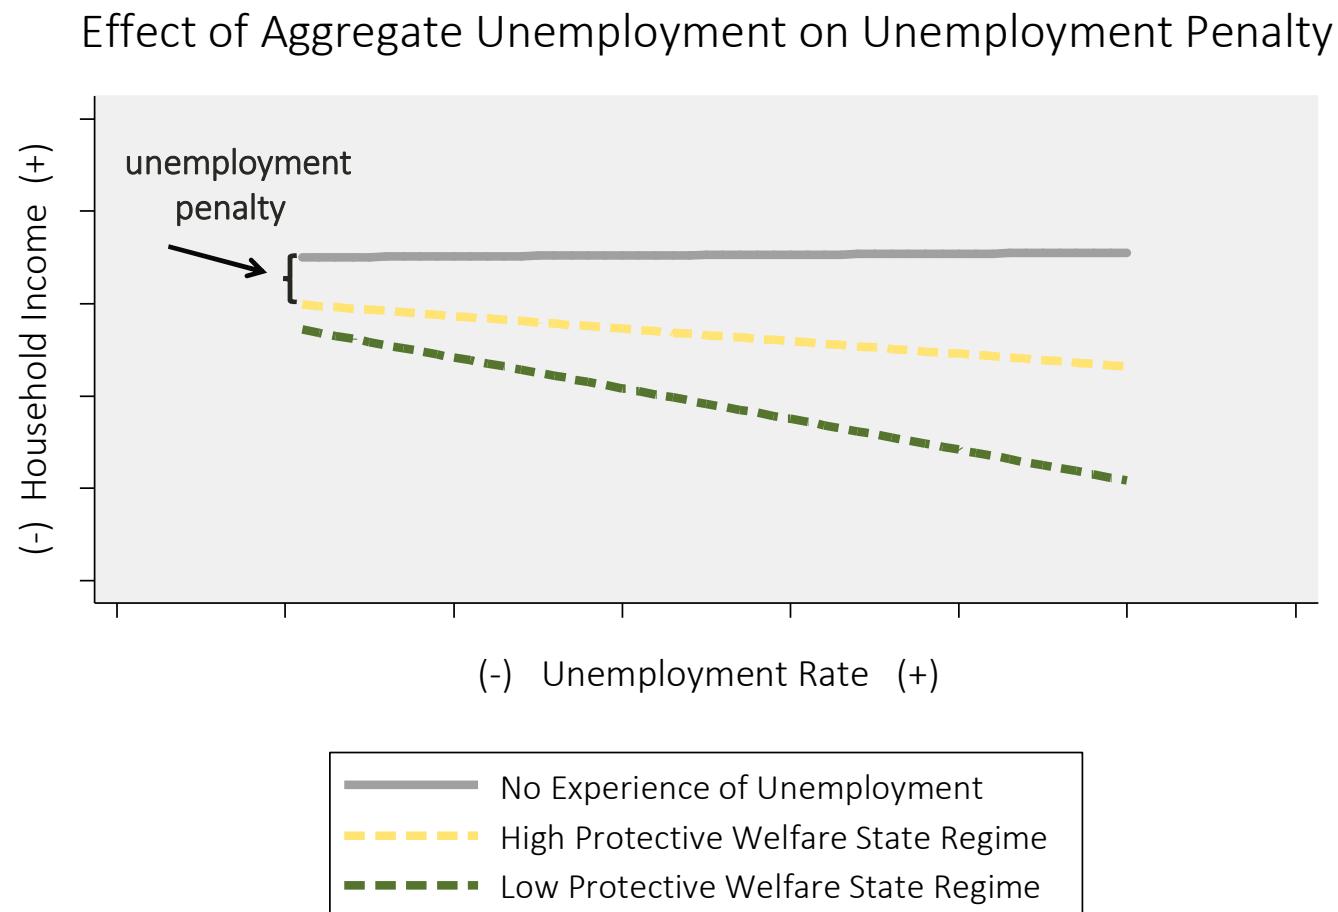

Source: Eurostat EU Labour Force Survey

Research questions

- How much does individual job loss affect household disposable income?
- To which extend do **welfare states/regimes** moderate the effect of unemployment on household disposable incomes?
- How does this effect vary with changes in **macro-economic conditions**?

Sensitivity of unemployment penalty to macro-economic conditions

Data

Harmonized Datasets (29 European Countries + USA):

- European Union Statistics on Income and Living Conditions (EU-SILC)
- British Household Panel Survey (BHPS)
- Socio-Economic Panel (GSOEP)
- Panel Study of Income Dynamics (PSID)
- Swiss Household Panel (SHP)

Period: 2003 - 2013

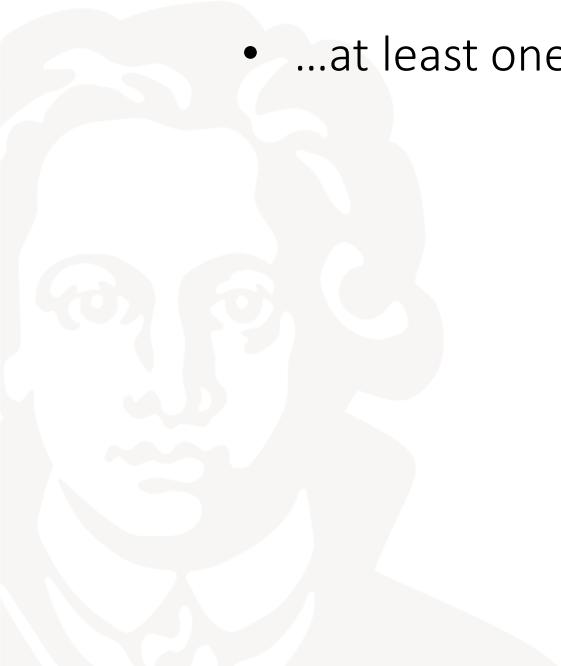

Structure:

- Person, household, country, welfare state
- Yearly observation
- Maximum of four periods per person (rotational panel)

Sample

We include all households at risk of experiencing unemployment, therefore these households must report...

- ...at least one person in the age between 16 – 65 years
- ...at least one period of employment by any household member

Sample

Two-Step Approach

1. Fixed-Effects Model:

- Controlling for household-specific time-constant unobserved heterogeneity
- Time fixed-effects (year)
- Panel-robust standard errors

Dep. var.: log of total household disposable income (HY020),
Incomes are adjusted to be comparable

Job loss indicator: employment calendar information (PL210A-L/PL211A-L),
moving from employment to unemployment

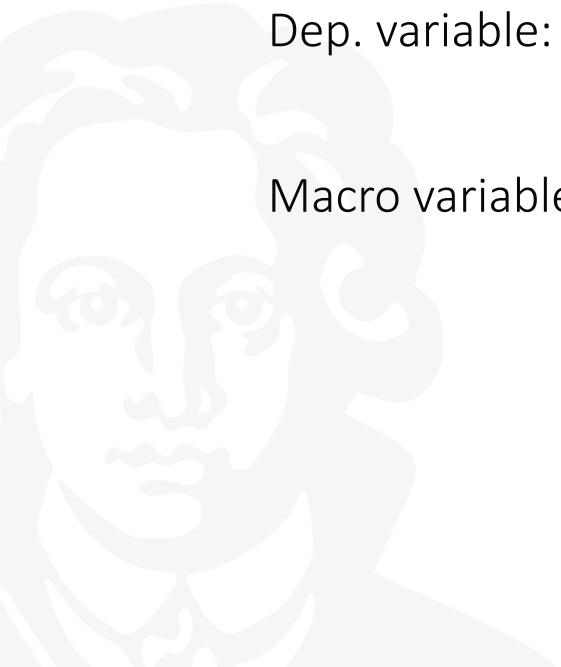

Controls: household employment capacity, coupled unemployment

Two-Step Approach

2. Estimated dependent variable (EDV) models:

Dep. variable: unemployment penalty

Macro variables: unemployment rate, long term unemployment rate,
unemployment insurance generosity, employment protection
legislation

Unemployment penalty on household disposbale income

source: EU-SILC, GSOEP, PSID, SHP, BHPS

Sensitivity of unemployment penalty to macroeconomic conditions

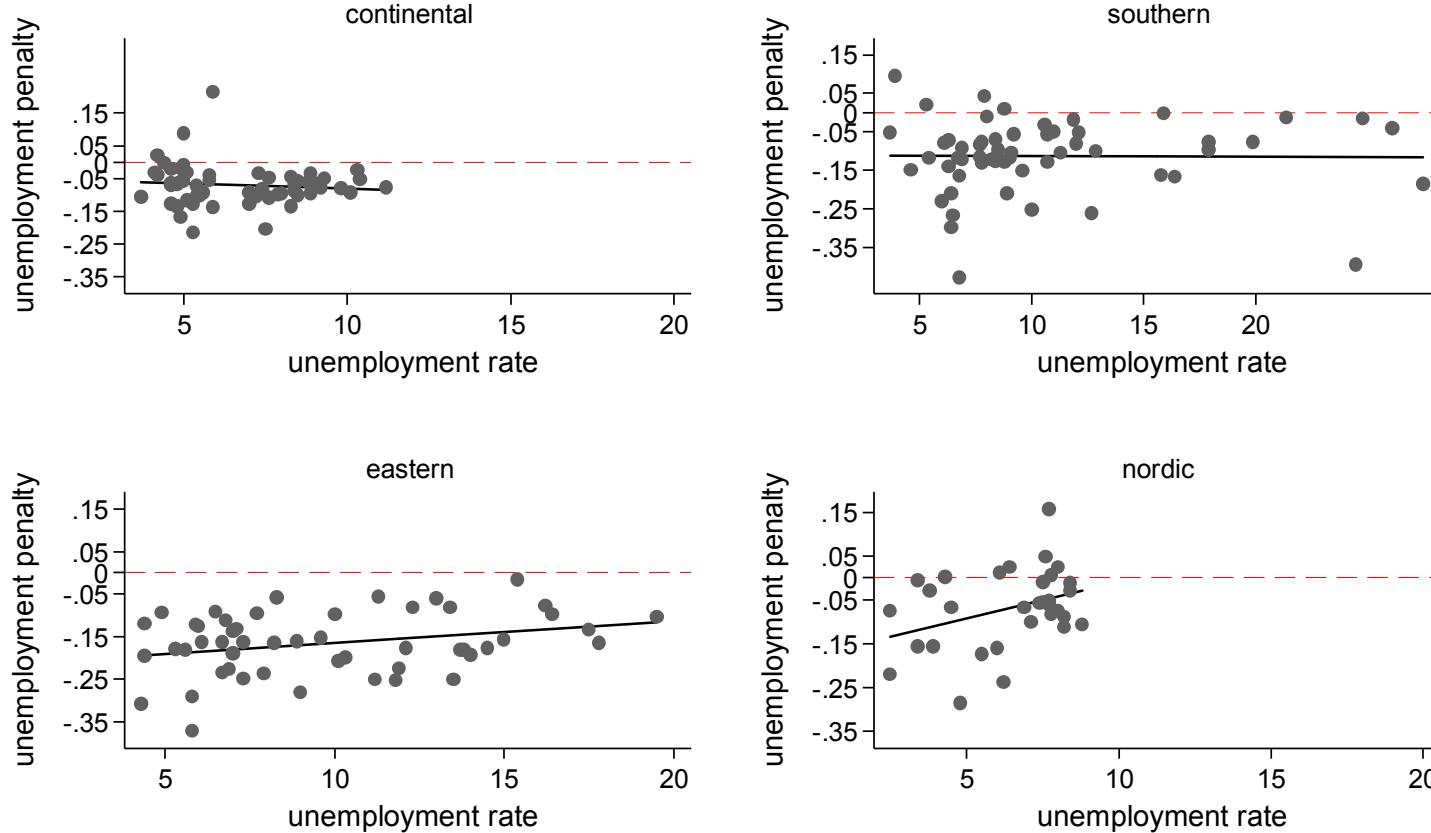

- Household Disposable Income -

Sensitivity of unemployment penalty to macroeconomic conditions

- long-term unemployed

- Household Disposable Income -

Conclusion

Welfare State Regimes:

- **Unemployment duration** is crucial for the effect of unemployment on household disposable income
- Unemployment penalty for household disposable incomes differs substantially between **welfare state regimes**

Macro-economic conditions:

- For now no indication of relationship between unemployment penalty and national unemployment rate
- Further macro-level analysis. Any suggestions for indicators?

Thanks for your attention!

source: EU-SILC, GSOEP, PSID, SHP, BHPS

Welfare state buffering of unemployment penalty (household level)

Contemporaneous Effect of Unemployment

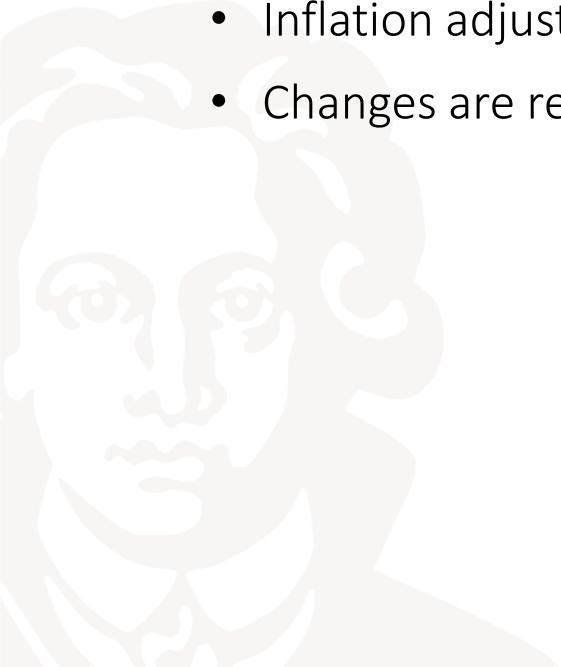

- Household Disposable Income -

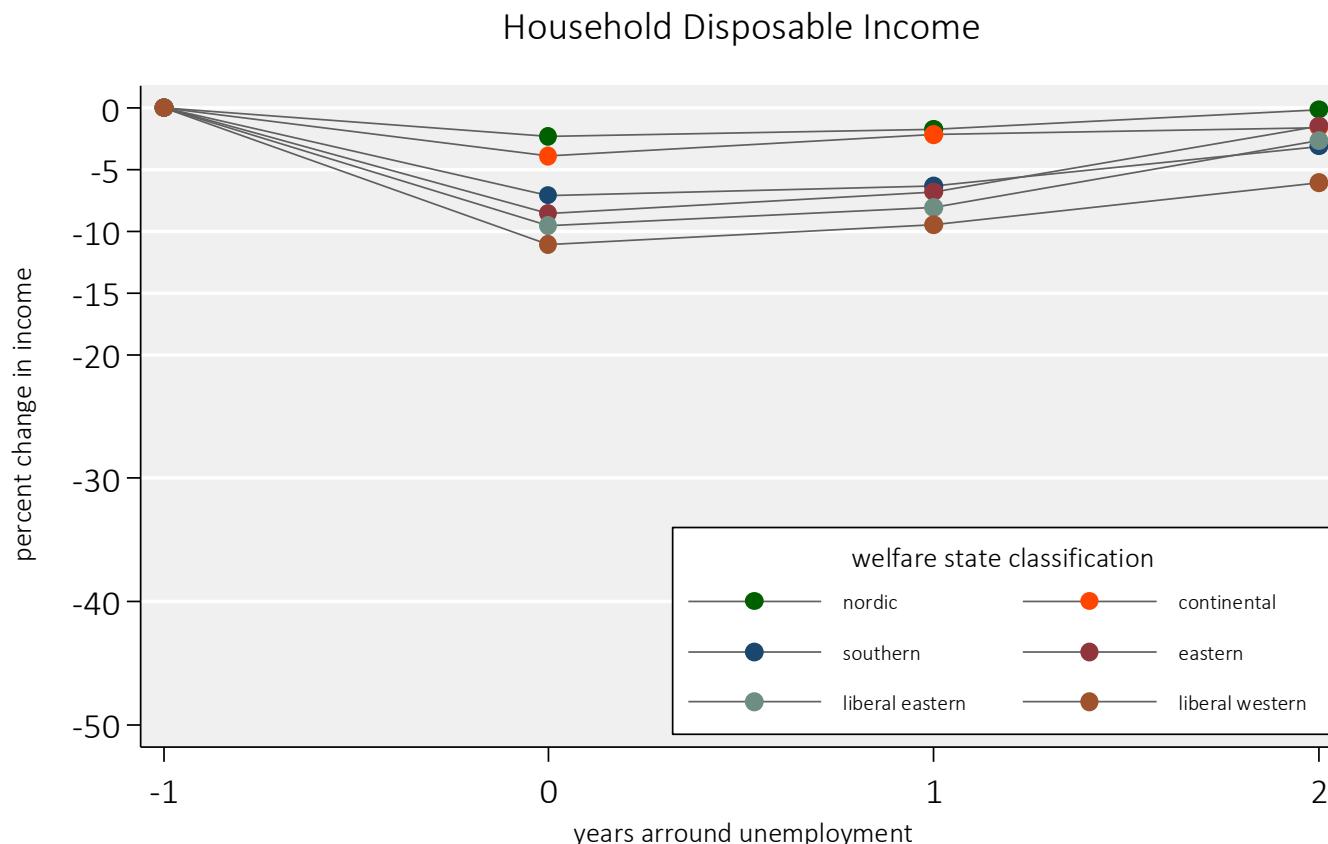

Income Adjustment

Adjustment of income variables:

- All currencies are converted to Euro values by yearly exchange rate
- Household incomes equivailzed using the oxford equivalence scale
- Inflation adjusted by the harmonized index of consumer prizes (b. 2005)
- Changes are restricted to max. 1000% of respective income
