EU-Labour Force Survey
December 2009 release

Setup for importing the Anonymised Yearly Data Sets for 2008

Content

I. Overview
II. Explanatory notes on the recoding of alphanumeric variables into numeric variables
III. Explanatory notes about the recoding of missing values
IV. Explanatory notes about specific recoding and the definition of variable and value labels
V. Notes on irregularities not mentioned in the User Guide
VI. Classifications

I. Overview

The following information will help you to import the EU-LFS 2008 yearly data. The data you received from Eurostat are formatted as comma separated values (csv). With the routines provided by GESIS’s German Microdata Lab, these data can be converted into SPSS.

The routine to convert the data into SPSS consists of two files:
Setup_EULFS_2008_y.sps
Labels_EULFS_2007-2009.sps

The setup provided by the German Microdata Lab achieves the following objectives:

– Transformation of EU-LFS 2008 yearly data from csv into sav (SPSS).
– Recoding of alphanumeric variables into numeric variables.
– Recoding of missing values.
For a first check of the converted data, you can compare the number of cases per country with the number of cases listed in table 1. Consistent numbers indicate that the execution of the setup was successful.

II. Explanatory notes on the recoding of alphanumeric variables into numeric variables

− COUNTRYW, COUNTR1Y
   The first two numbers indicate the region, according to the country codification from 2007. Countries not explicitly assigned to one region by this classification have been classified by GESIS.
   The last two digits display the order for the country in alphabetical order as given by the ISO 3166-1-alpha-2 code elements (e.g. Algeria=0501). The last two digits for countries which have been surveyed remain the same as in the COUNTRY Variable (e.g. Bulgaria=0103). The alphanumerical code from the EU-LFS deviated from the ISO classification in regard to two countries: XS instead of RS for Serbia and UK instead of GB for the United Kingdom.
   In Slovenia, the coding of COUNTRYW in the raw data differs from the other countries (see User Guide 2009). Thus the recoding within the Setup is different as well.

− HHNUM, QHHNUM, QUARTER, REGION, REGIONW, REGION1Y
   These variables have a large amount of values or – in case of QUARTER – only one value. Thus they remain alphanumeric.

III. Explanatory notes about the recoding of missing values

Coding standard for missing values:
− -1 for "No answer"
− -2 for "Not applicable"
− -3 for "Not available"
− in exceptional cases -9 for "Otherwise" (only LEAVCLAS) and -101 for "No answer" and -102 for "Not applicable" (only LEAVTIME and STARTIME, see below)

In SPSS these missing values are declared as user-missing values.

The Code -3 for "Not available" is assigned, if a variable has no valid cases in a country. Some of these variables have only system-missings (i.e. blanks) in the raw data of the respective country, others have only cases with "No answer" and/or "Not applicable". For detailed information on which variables have no valid cases in which countries and have thus been recoded to -3 see table 2.

2 http://www.iso.org/iso/country_codes/iso_3166_code_lists/country_names_and_code_elements.htm
Specifics and exceptions:

- **COUNTRYB, NATIONAL**
  The code -1 includes not only cases without a valid answer, but also suppressed cases, cases with the original code "Other or Stateless", and in some countries certain other cases (see User Guide 2009, p. 63).

- **HWUSTRAI, LENTR4W, PURP4W**
  These variables have no valid cases in the anonymised data sets of all countries. Thus they have been recoded to -3.

- **LEAVTIME, STARTIME**
  These variables have valid negative values. Thus the missing value category is set to -101 (for "No answer") and -102 (for "Not applicable"). Furthermore there were no cases with the value 999 in the raw data, as mentioned in the User Guide 2009 for "Not applicable". Thus the "Not applicable" category has been derived with help of the filtering variables EXISTPR (for LEAVTIME) and WSTATOR (for STARTIME) (see User Guide 2009, p. 32 f.).

- **MARSTAT**
  In France and Slovenia children under the age 15 had not been asked about their marital status. Thus -1 for "No answer" has been recoded to -2 for "Not applicable" in those cases.

IV. Explanatory notes about specific recoding and the definition of variable and value labels

- **ISCOPR3D, ISCO3D**
  A number of cases belonging to the category "armed forces" had been coded incorrectly in the 3-digit ISCO code. This became obvious while crosstabulating the 1-digit with the 3-digit ISCO code. Thus these cases have been recoded.

- **REGION, REGIONW, REGION1Y**
  The values of these variables have country-specific meanings (according to the NUTS classification). Thus they remain unlabelled.

V. Notes on irregularities not mentioned in the User Guide

- **AGE**
  No persons under the age of 15 and over the age of 74 were surveyed in Iceland, Norway and Sweden.

- **COEFF**
  There are a substantive number of cases with a weighting factor of zero in France, Poland and Spain. There are some system-missings in Finland and the UK.

- **COURLEN**
  There is an unusual high frequency of cases with 300 hours in France.

---

- **HHSEQNUM**
  In Iceland and Sweden all cases have the value 1. In Romania one case is system-missing. Its origin is unclear.
- **INTWEEK**
  There are some system-missings in Denmark, France, Norway, Portugal and Sweden. The origin of these missings is unclear.
- **NOWKREAS**
  There are some system-missings in Iceland. The origin of these missings is unclear.

VI. Classifications

- **ISCED classification (HATLEVEL):**
- **other classifications used in the EU LFS:**
  http://circa.europa.eu/irc/dsis/employment/info/data/eu_lfs/LFS_MAIN/Coding_lists_explanatory_notes_and_classifications/Index_EU_LFS_coding_lists_explanatory_notes_and_classifications.htm
