

EU Labour Force Survey
November 2022 Release
(DOI: 10.2907/LFS1983-2021)

Setup for Importing the Anonymised Yearly Data Sets for 1983-2021

Content

- I. Overview
- II. Explanatory notes on the recoding of alphanumeric variables into numeric variables
- III. Explanatory notes on the recoding of missing values
- IV. Remarks on particularities
- V. Classifications

I. Overview

The following information will help you to import the EU Labour Force Survey (EU-LFS) 1983-2021 yearly data. The data you received from Eurostat are formatted as comma separated values (csv). With the routines provided by GESIS's German Microdata Lab, these data can be converted into SPSS and Stata.

The routines to convert the data into SPSS or Stata consist of a setup and a label syntax. The setup is year-specific from 2005 onwards, and universal for the years before. The label syntax is universal for all years. For the years from 2006 to 2021, an additional recoding syntax for a core set of variables is additionally required:

Year	Setup (.sps/.do)	Recoding Syntax (.sps/.do)	Label Syntax (.sps/.do)
2006-2021	Setup_EULFS_2021_y Setup_EULFS_2020_y ... Setup_EULFS_2007_y Setup_EULFS_2006_y	RecodeVar_EULFS_2006-2021	Labels_EULFS_1983-2021
2005	Setup_EULFS_2005_y	-	
1983-2004	Setup_EULFS_1983-2004_y		

To get the routines running, you just need to configure the setup. After you have specified all relevant paths and the csv data to be read, everything else runs automatically.

The routines achieve the following objectives:

- Transformation of EU-LFS data from csv into sav (SPSS) and into dta (Stata)
- Recoding of alphanumeric variables into numeric variables
- Recoding of missing values
- Assigning a release variable (RELEASE)
- Definition of variable and value labels (by executing the label syntax)

For a first check of the converted data, you can compare the number of cases per country with the number of cases listed in Table 1 (see below). Consistent numbers indicate that the execution of the setup was successful.

II. Explanatory notes on the recoding of alphanumeric variables into numeric variables

– QUARTER, QHHNUM

QUARTER has only one value, and QHHNUM has a large number of values. Thus, they remain alphanumeric.

– COUNTRY

Compared to previous data releases, the alphanumerical code for Greece has changed from "GR" to "EL". Thus, the numerical codes for COUNTRY have changed as well.

– COUNTRYW, AHM2021_HATCNTR

Alphanumeric country codes in the LFS are based on the ISO 3166 alpha-2 code.¹ Exceptions are Greece, which is coded as EL (instead of GR in ISO), and the United Kingdom, which is coded as UK (instead of GB in ISO).

Numeric country codes are assigned according to ISO as well.² For Kosovo, which has no numeric ISO code yet, we assigned code 899.

In some countries, the coding of COUNTRYW and AHM2021_HATCNTR is different. In these countries, COUNTRYW and AHM2021_HATCNTR are aggregated in the same way as CITIZENSHIP and COUNTRYB (see User Guide, Version February 2023, p.99, p.101).

– REGION_2D, REGION_2DW

The values of these variables have country-specific meanings (according to the NUTS classification).³ That is why they are attached to the consequent country variables (COUNTRY, COUNTRYW). The new codes consist of 4 digits: Digits 1 and 2 are similar to the (alphanumeric) codification of COUNTRY/W, digits 3 and 4 are similar to the original codification of REGION_2D/W.

¹ https://ec.europa.eu/eurostat/statistics-explained/index.php?title=EU_labour_force_survey_-_documentation#Classifications

² e.g., https://en.wikipedia.org/wiki/ISO_3166-1

³ https://ec.europa.eu/eurostat/statistics-explained/index.php?title=EU_labour_force_survey_-_documentation#Coding_lists.2C_explanatory_notes_and_classifications_used_over_time

Where COUNTRYW is aggregated in pre-IESS codes, the digits 1 and 2 of REGION_2DW have the following meaning:

01 European Union (EU15)	09 South America
02 Other European Economic Area	10 East Asia
03 Other Central and Eastern Europe	11 Near and Middle East
04 Other Europe	12 South and Southeast Asia
05 North Africa	13 Australia, Oceania and other territories
06 Other Africa	14 Other or stateless
07 North America	15 EU acceding countries
08 Central America and Caribbean	

– YEARESID

In the range from 0 to 9 years, YEARESID is provided in single years. Exceptions are Malta and Slovenia, where all values up to 74 are aggregated to 5-year bands (see User Guide, Version February 2023, p. 99). This is documented in the appropriate value labels.

III. Explanatory notes on the recoding of missing values

Coding standard for missing values:

<i>in SPSS and Stata</i>	<i>in Stata (optional)</i>	<i>Labels</i>
-1	.a	"Not stated" or "No answer"
-2	.b	"Not applicable"
-3	.c	"Not available"
-4	.d	"Not specified"
-5	.e	"Otherwise" in exceptional cases (only LEAVCLAS and DURUNE)

In SPSS these missing values are declared as user missing values.

The Code -3/.c for "Not available" is assigned, if a variable has no valid cases in a country. Some of these variables have only system missings (i.e., blanks) in the raw data of the respective country, others have only cases with "Not stated" and/or "Not applicable".

Please note:

Optionally, missing values in Stata can be encoded as the extended missing values .a, .b, .c, etc. by reinserting the block "Declare User-Missing Values" at the end of the respective setup.

Specifics and exceptions:

– AGE

There are missing values for AGE in some countries. They were manually recoded to -3 for "Not available".

– HHPERS

Other than stated in the User Guide (Version February 2023, p. 86), there are missing values for HHPERS. In analogy to the other derived variables at household level, they were recoded to -4 for "Not specified".

IV. Remarks on particularities

Note that the weighting factors (COEFFY, COEFFMOD, COEFFHH, COEFFHHAvg and COEFF2Y) can be zero or missing. This is correct and can be used to select the (sub)samples for the analysis of quarterly, annual, biennial, module and household variables (see "Information note on the use of the 2022 release of EU LFS scientific use files" you received together with the csv data from Eurostat).

In addition, some variables contain system missing values in various countries and years that should not exist (according to the User Guide). These system missing values are not changed in the setups and remain in the converted data. Table 2 gives an overview of their frequency.

The variable HHTYPE contains the unknown value 4 in the Italian data from 1983 to 1991, which is not mentioned in the User Guide and thus not labeled.

The maximum value of AGE in the data from 1983 to 1997 is 99. Presumably, this value also covers those who are older than 99, but it's not entirely certain. Therefore code 99 is not labeled accordingly. The same is true for AGE_GRP, where the highest value in the data from 1983 to 1997 is 97, representing the age group 95 to 99. Again, this value probably includes older persons.

V. Classifications

For information on the classifications used in the EU-LFS, see

https://ec.europa.eu/eurostat/statistics-explained/index.php?title=EU_labour_force_survey_-documentation#Classifications
