GESIS Summer School in Survey Methodology
Cologne, August 2020

Syllabus for course 1:
“Questionnaire Design”

Instructor: Prof. Dr. Marek Fuchs
Email: fuchs@ifs.tu-darmstadt.de
Homepage: https://www.ifs.tu-darmstadt.de/institut_ifs/mitarbeitende_ifs/fuchs_ifs/index.de.jsp

Date: 03-07 August 2020
Time: 09:00-12:00 + 13:30-16:30
Time zone: CEST, course starts on Monday at 09:00
Venue: Online via Zoom

About the Instructors:
Prof. Dr. Marek Fuchs is full professor for social science research methods at Darmstadt University of Technology, Germany. He obtained his PhD from Kassel University in 1993 and conducted post-doctoral work at the University of Michigan, Ann Arbor (USA). Since then, he has been the principal investigator of several large scales surveys. His methodological research is particularly concerned with methodological aspects of survey measurement. Over the course of the past 25 years, he has published on laboratory and field-experimental studies concerning questionnaire design for face-to-face surveys, telephone surveys and self-administered surveys (paper & pencil as well as web and mobile web surveys). He has a long standing experience in teaching courses on survey methodology at the PhD and Master levels to an international audience.

Selected Publications:

Short Course Description:
Briefly speaking, the quality of survey answers provided by respondents can only be as good as the questions being asked. Thus, an effective questionnaire is a key component of a survey contributing to overall data quality. In addition to an overview of theoretical principles underlying questionnaire design this course particularly aims at providing evidence-based practical advice on how to design good survey questions and questionnaires. Based on field-experimental studies evaluating various aspects of questionnaire design participants will acquire state of the art knowledge concerning questionnaire design. The course offers the opportunity to apply these competencies under the supervision of the lecturer in group exercises and assignments. The course will strengthen participants’ ability to design effective survey questions and to integrate them into a meaningful questionnaire.
Keywords:
questionnaires, survey research, measurement

Course prerequisites:
Basic knowledge in quantitative social science research methods is required; basic knowledge concerning survey design and data quality is advisable. Participants not familiar with the total survey error framework are encouraged to consider the preparatory reading mentioned at the end of this syllabus. There are no statistical prerequisites. However, for performing the practical exercises in this course, participants will need a laptop or desktop computer with an office suite or word processor installed.

Target group:
Participants will find the course useful if they:
- plan to or are about to conduct a survey;
- would like to supplement their initial experience in designing questionnaires with practical advice based on a sound theoretical basis concerning the underlying mechanisms.

Course and learning objectives:
By the end of the course participants will:
- have an overview concerning the various components of survey data quality in general and questionnaire quality in particular;
- understand the cognitive processes underlying survey measurement for the various survey modes;
- be able to design simple survey questions of various types and to combine them in an integrated survey instrument.

Organizational structure of the course:
This is a five-day course with a total amount of 24 hours of virtual class time. Participants can expect a mix of interactive teaching (3 hours per day), exercises, and opportunity for individual consultation (2 hours per day). Participants can either bring their own project that they want to use for the assignments or they are provided with literature from two substantive areas to choose a topic for their assignments. Additional time of 1-2 hours a day has to be scheduled for preparation, further reading and desk work.

Software and hardware requirements:
For performing the practical exercises in this course, course participants will need a laptop or desktop computer with an office suite or word processor installed.

Long Course Description:
In traditional text books questionnaire design is typically treated as an "art". Designing questions and questionnaires is broadly described as an important step when planning a survey however little advice is provided on how to phrase individual questions and how to design a good questionnaire as a whole. The rules and instructions given in such texts are either too specifically concerned with particular substantive questions—and accordingly those rules cannot be generalized to other questions—or the advice given is too broad and general and it is left to the reader to apply the general rules to his or her specific survey questions.

This course on questionnaire design will avoid this dilemma. Instead of providing general or specific rules on how to design a good survey question and a questionnaire as a whole, the course will approach the science of questionnaire design by means of two strategies: On the one hand basic concepts relevant to survey measurement will be discussed (e.g. mode differences, question-answer-process, satisficing, social desirability) in order to make participants aware of the mechanisms underlying survey measurement. On the other hand, participants will be introduced to results of field-experimental studies testing various aspects of a survey question and a questionnaire as a whole (e.g. question wording, response order, visual design of a question). The discussion of these studies will highlight the implication of various design aspects of a survey question for the responses provided by respondents.

Thus, the lectures provide scientific background knowledge and educate participants in their professional reasoning when designing survey questions and a questionnaire as a whole. Based on the theoretical concepts and ex-
Experiments discussed in the lectures, participants will be guided and supported in designing a topical survey questionnaire during practical sessions and by means of assignments. The work on the questionnaire starts with a discussion of the indicators to be measured and continues with the development of a set of corresponding survey questions (including all most prevalent question types). Finally, the questions will be combined into a questionnaire and tested. During the time for exercise and feedback on assignments by the instructor (2 hours a day) the instructor will be available for questions and discussion of individual projects. Participants should be prepared to spend an additional 1–2 hours a day for preparatory work, reading, and desk research. The questionnaire in the practical session will be developed using Office software; no specialized software package will be used. The course will use mainly examples from surveys of individuals and households. The course is not restricted to a specific survey mode.

Day-to-day schedule and literature used in the course:

<table>
<thead>

### Lecture 5:
Behavioral frequency questions (open, closed)

Practical session 3:
Exercise on designing behavioral frequency questions
Discussion of Assignments

### Lecture 6:
Open-ended and closed-ended questions

Group Assignment 3:
Developing an open-ended and closed ended question

Individual counseling by appointment 3:

**Compulsory reading:**

**Literature for the assignment:**

### Lecture 7:
Dealing with social desirability and asking sensitive questions

Practical session 4:
Exercise on designing a sensitive question
Discussion of Assignments

### Lecture 8:
Multiple response questions (if time permits)
Response order effects
Pre-test methods

Group assignment 4:
Conducting a pre-test

Individual counseling by appointment 4:

**Compulsory reading:**

**Suggested reading:**

**Literature for the assignment:**

Lecture 9:
Surveys on mobile devices (if time permits)
Mixed-mode surveys and uni-modal design

Practical session 5:
Exercise on designing uni-modal questions
Discussion of Assignments

Lecture 10:
Question order effects
From questions to a questionnaire

Individual counseling by appointment 5:

Compulsory reading:

Preparatory reading:

Additional recommended literature:
This article offers a comprehensive overview concerning the design of attitude and behavior questions.

The following text books offer a comprehensive introduction to the cognitive processes underlying survey measurement.
